²Developed and edited by Tyrone Vincent and Kathryn Johnson, Colorado School of Mines, with contributions from Salman Mohagheghi, Chris Coulston, Kevin Moore, CSM and Matt Kupilik, University of Alaska, Anchorage <

Step 1: Factor out constant terms

$$\begin{aligned} G(s) &= \frac{5(-50)}{100s^2} \frac{(s+1)(\frac{s}{-50} + 1)}{\left(\left(\frac{s}{10}\right)^2 + \frac{s}{10} + 1\right)} \\ &= \frac{-2.5}{s^2} \frac{(s+1)(\frac{s}{-50} + 1)}{\left(\left(\frac{s}{10}\right)^2 + \frac{s}{10} + 1\right)} \end{aligned}$$

the term $\frac{-2.5}{s^2}$ is called the *low frequency term*

Step 2: List break frequencies and important info

Break Frequency	Item (P/Z? L/RHP? #?)	Magnitude Slope	Phase Slope
1 rad/s	1 LHP zero	20 dB/dec	$45^\circ/\text{dec}$
10 rad/s	2 LHP poles	-40 dB/dec	$-90^\circ/\text{dec}$
50 rad/s	1 RHP zero	20 dB/dec	$-45^\circ/\text{dec}$

Step 3: Calculate gain and phase of low frequency term ($2.5/s^2$). To calculate the magnitude, we pick a frequency less than or equal to all break frequencies. In this case 1 rad/s is convenient, so we plug in $s = j\omega$ with $\omega = 1$:

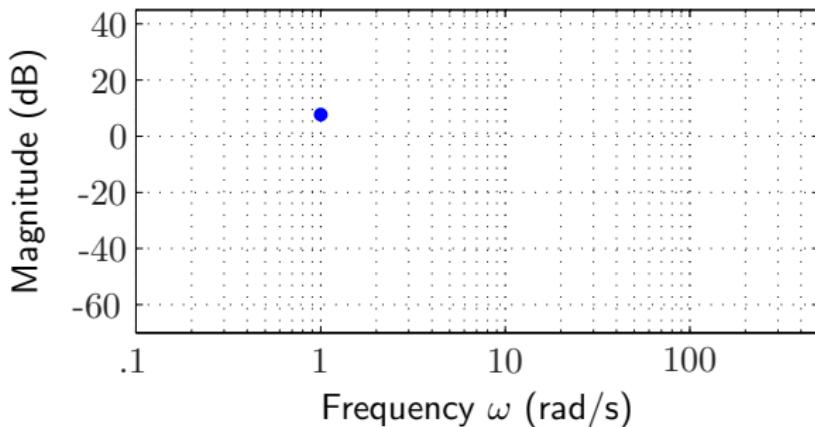

$$\left| -\frac{2.5}{s^2} \right|_{s=j} = \frac{|-2.5|}{|j^2|} = \frac{2.5}{1} = 2.5$$

Thus, at 1 rad/s, the magnitude is $20 \log_{10}(2.5) = 7.96$. To calculate low frequency phase, you can always just plug in j

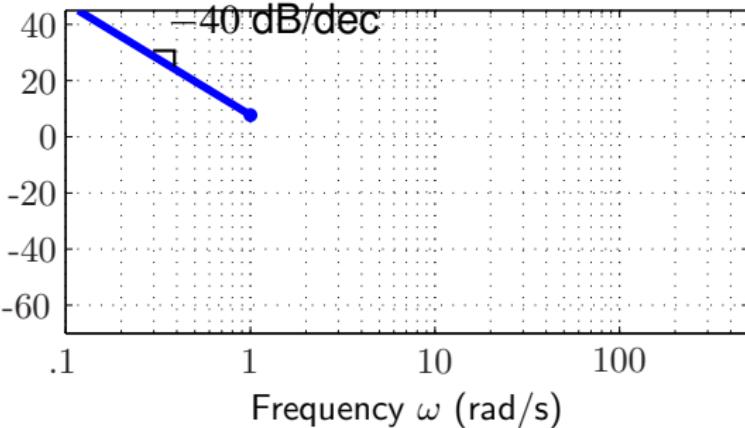

$$\angle -\frac{2.5}{s^2}_{s=j} = \angle \frac{-2.5}{j^2} = \angle \frac{-2.5}{-1} = \angle 2.5 = 0^\circ$$

In this case, the low frequency phase is 0° .

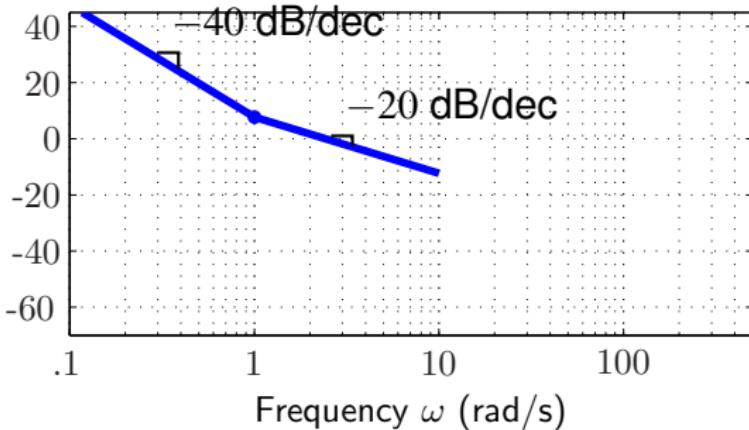

Step 4: Draw magnitude plot, starting from lowest frequencies.

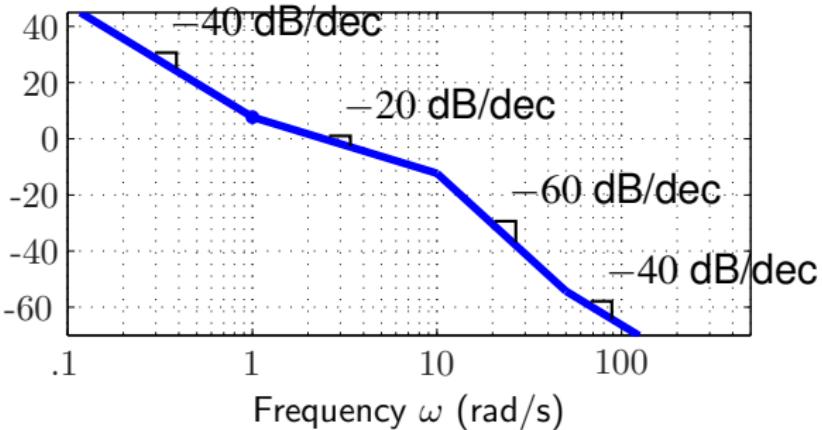

Magnitude (dB)

Magnitude (dB)

Magnitude (dB)

Step 5: Draw phase plot
