# Across and Through Variables

Domain	Across Variable	Through Variable
Electrical	Voltage	Current
Translational Mechanical	Position	Force
Fluid	Pressure	Flow
Rotational Mechanical	Angular Position	Torque

# Rotational Impedance

	mass	spring	damper
Component	 $\theta$	 $\theta = \theta_1 - \theta_2$	 $\dot{\theta} = \dot{\theta}_1 - \dot{\theta}_2$
Laplace Transform	$\theta(s) = \frac{1}{J s^2} \tau(s)$	$\theta(s) = \frac{1}{k} \tau(s)$	$\theta(s) = \frac{1}{b s} \tau(s)$
Impedance Component (force direction agrees with positive direction)	 $\tau(s)$	 $\theta_1$	 $\theta_1$

# Hard Disk Drive Read Head

In order to move the read head to the correct track and hold it there, we need to be able to predict the relationship between the motor torque  $\tau$  and the angular position of the read head  $\theta_2$ . First, find the equivalent impedance model. Then, find the transfer function  $\frac{\theta_2}{\tau}$ .

# Disk Drive Complete Circuit

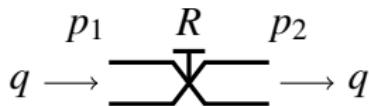

# Tank

The change in the volume  $V$  of fluid inside the tank is equal to the difference between the input and output volumetric flow rates,  $q_1$  and  $q_2$ , respectively, in this diagram:

# Linear Valve

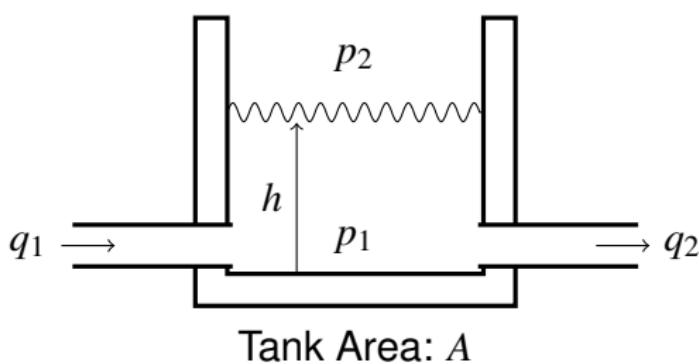

A valve causes a restriction that causes the pressure on one end of the valve to be higher than the other end. When this pressure drop is proportional to the flow, the valve is linear with valve constant  $R$ . (Most valves are nonlinear, however.) By unit analysis, the units of valve resistance are [ $\text{N s m}^{-5}$ ] or equivalently [ $\text{kg m}^{-4}\text{s}^{-1}$ ].

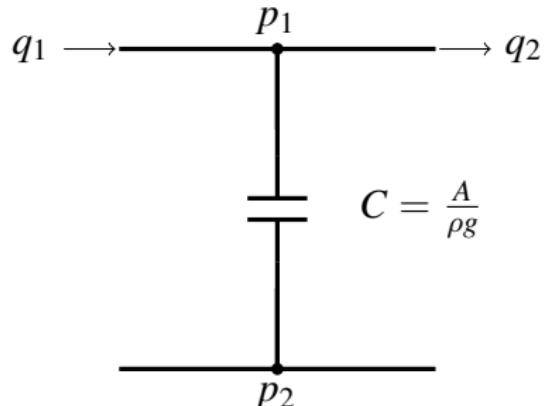

$$p_1 - p_2 = Rq$$

# Electrical Analogy for Fluid Elements:

## Tank

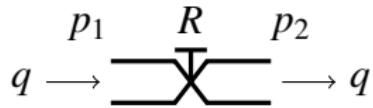

$$\frac{A}{\rho g} \frac{d(p_1 - p_2)}{dt} = q_1 - q_2$$

$$C \frac{d(p_1 - p_2)}{dt} = q_1 - q_2$$

# Electrical Analogy for Fluid Elements:

## Valve

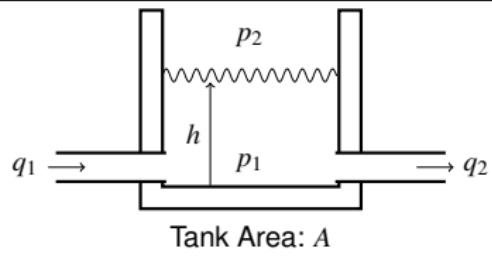

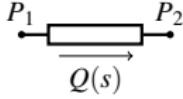

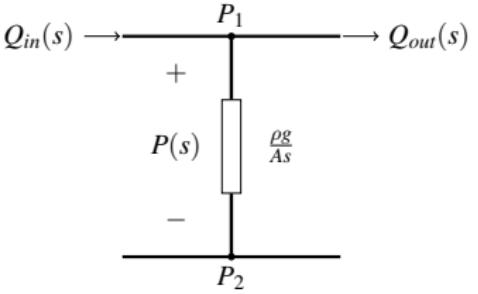

$$p_1 - p_2 = Rq$$

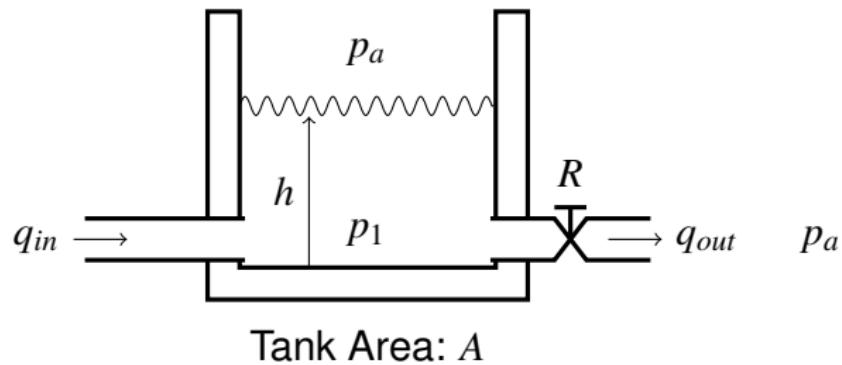

$$p_1 - p_2 = Rq$$

# Fluid Impedances

	<b>valve</b> $p = p_1 - p_2$ $p_1 \xrightarrow{R} p_2$ $q \rightarrow$	<b>tank</b>  Tank Area: $A$
Component		
Component law	$p = Rq$	$\frac{A}{\rho g} \frac{dp}{dt} = q_{in} - q_{out}$
Laplace Transform	$P(s) = RQ(s)$	$\frac{A}{\rho g} sP(s) = Q_{in}(s) - Q_{out}(s)$
Impedance Component	$+ \frac{P(s)}{R} -$ 	

# Tank and Valve Problem

*Example:* Find the equivalent impedance model of the tank and valve system below with input flow  $q_{in}$  and output flow  $q_{out}$ .

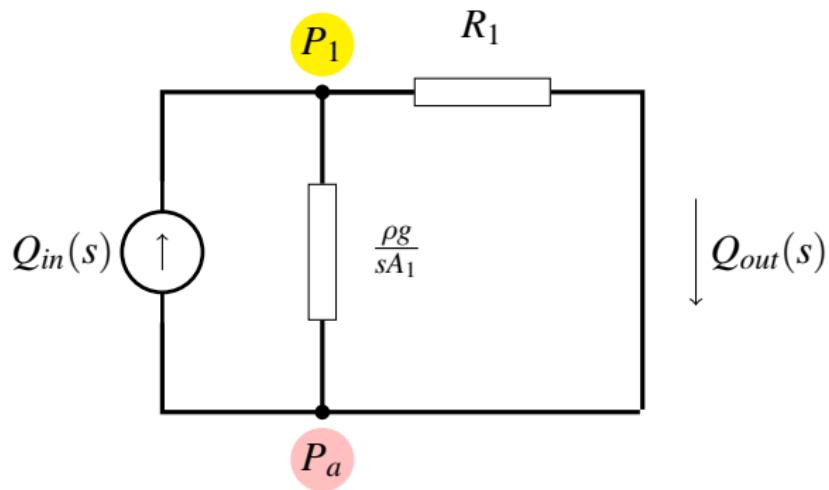

# Tank system nodes

$P_1$   
•

$P_a$   
•

# Tank system impedance model

# Tank and Valve Example

Assume the valve is linear with valve constant  $R$  and that the density of the fluid is  $\rho$ . The valve empties to atmospheric pressure,  $p_a$ , which is the same as the pressure at the top of the tank.
